

NOVI genski podatki kažejo, da je Evropa poseljena bistveno dlje kot smo mislili do sedaj. Keltski jezik se povezuje z nekim izumrlim jezikom. Podatki najnovjših raziskav pa kažejo, da keltski jezik še po 2.500 letih z lahkoto razumejo preprosti govorci slovenskega narečja. Venetski jezik je raziskovalo že mnogo strokovnjakov, vendar neuspešno. Znanstveniki niso uspeli razvozlati niti venetskega napisa, zapisanega v latinskih črkah.

THE NEW genetic data show that the Europe was settled much earlier than we thought till now. The latest studies show that the Celtic language is easily understandable to the average speaker of some present Slovene dialects, even after 2.500 years. The Venetic language was studied unsuccessfully by many scholars. Even the Venetic inscription written in Latin script stayed a mystery.
